

Lab 4: Windows Failed Login Detection and Investigation Using Wazuh

Three intentional failed-login attempts were generated on the Windows endpoint. Windows recorded the activity as Security Event ID 4625. The Wazuh agent forwarded the events to the Wazuh manager, where they triggered rule 60122 at severity level 5. Investigation confirmed a local interactive login attempt, Logon Type 2, originating from 127.0.0.1 and targeting the Administrator account. The event was determined to be authorized lab activity rather than malicious access.
